3D

given two points:
(x_1, y_1, z_1) and (x_2, y_2, z_2),
Distance between them:
$\sqrt{(x_1-x_2)^2 + (y_1-y_2)^2 + (z_1-z_2)^2}$
Midpoint:
$(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}, \frac{z_1+z_2}{2})$
Sphere with center (h,k,l) and radius r:
$(x-h)^2 + (y-k)^2 + (z-l)^2 = r^2$

Vectors

Vector: $\vec{u}$
Unit Vector: $\hat{u}$
Magnitude: $||\vec{u}|| = \sqrt{u_1^2 + u_2^2 + u_3^2}$
Unit Vector: $\hat{u} = \frac{\vec{u}}{||\vec{u}||}$

Dot Product
$\vec{u} \cdot \vec{v}$
Produces a Scalar
(Geometrically, the dot product is a vector projection)
$\vec{u} =< u_1, u_2, u_3 >$
$\vec{v} =< v_1, v_2, v_3 >$
$\vec{u} \cdot \vec{v} = \vec{0}$ means the two vectors are Perpendicular θ is the angle between them.
$\vec{u} \cdot \vec{v} = ||\vec{u}||\ ||\vec{v}|| \cos(\theta)$
$\vec{u} \cdot \vec{v} = u_1v_1 + u_2v_2 + u_3v_3$
NOTE:
$\hat{u} \cdot \hat{v} = \cos(\theta)$
$||\vec{u}||^2 = \vec{u} \cdot \vec{u}$
$\vec{u} \cdot \vec{v} = 0$ when $\perp$
Angle Between $\vec{u}$ and $\vec{v}$:
$\theta = \cos^{-1}(\frac{\vec{u} \cdot \vec{v}}{||\vec{u}||\ ||\vec{v}||})$
Projection of $\vec{u}$ onto $\vec{v}$:
$pr_{\vec{v}}\vec{u} = (\frac{\vec{u} \cdot \vec{v}}{||\vec{v}||^2})\vec{v}$

Cross Product
$\vec{u} \times \vec{v}$
Produces a Vector
(Geometrically, the cross product is the area of a paralellogram with sides $||\vec{u}||$ and $||\vec{v}||$)
$\vec{u} =< u_1, u_2, u_3 >$
$\vec{v} =< v_1, v_2, v_3 >$

$$\vec{u} \times \vec{v} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$$

$\vec{u} \times \vec{v} = \vec{0}$ means the vectors are parallel
$\vec{a} \times (\vec{b} \times \vec{c}) = (\vec{a}.\vec{c})\vec{b} - (\vec{a}.\vec{b})\vec{c}$

Volume of Parallelpiped

$$(\vec{v} \times \vec{u}).\vec{w}$$

However, in the case the question gave you three vectors directly

$$Volume = det\left(\begin{bmatrix} v_1 & v_2 & v_3 \\ u_1 & u_2 & u_3 \\ w_1 & w_2 & w_3 \end{bmatrix}\right)$$

Lines and Planes

Equation of a Plane
(x_0, y_0, z_0) is a point on the plane and
$< A, B, C >$ is a normal vector
$A(x-x_0) + B(y-y_0) + C(z-z_0) = 0$
$< A, B, C > \cdot < x-x_0, y-y_0, z-z_0 >= 0$
$Ax + By + Cz = D$ where
$D = Ax_0 + By_0 + Cz_0$

Equation of a line
A line requires a Direction Vector
$\vec{u} =< u_1, u_2, u_3 >$ and a point (x_1, y_1, z_1)
Parametric equation:
$x = u_1t + x_1 \quad y = u_2t + y_1 \quad z = u_3t + z_1$
Symmetric equations:
$t = \frac{x-x_1}{u_1} = \frac{y-y_1}{u_2} = \frac{z-z_1}{u_3})$
Distance from a Point to a Plane
The distance from a point (x_0, y_0, z_0) to a plane Ax+By+Cz=D can be expressed by the formula:
$d = \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2+B^2+C^2}}$

A line intersects a plane Just put the equations of x, y, z in the equation of the plane given, and solve for t. Then you'll have the points.

Distance between two skew lines through $P_1P_2,\ P_3P_4$

$$D = \frac{Vol_{parallelepiped}}{Area_{base}} = \frac{|(\vec{P_1P_2} \times \vec{P_3P_4}).\vec{P_1P_3}|}{|\vec{P_1P_2} \times \vec{P_3P_4}|}$$

Or go for the intuitive approach of forcing perpendicularity.

If two vectors are parallel $|\vec{v_1} \times \vec{v_2}| = 0$

Distance between a point and a line $\vec{v}$
$D = \frac{|\vec{Pv_0} \times \vec{v}|}{|\vec{v}|}$
